SUPPLEMENTAL FIG. S5. Box plot of *L. monocytogenes* 10403S invasion efficiency into Caco-2 tissue culture cells inoculated with varying *L. monocytogenes* concentrations. Invasion assays were performed with *L. monocytogenes* strains grown to stationary phase under shaking conditions. Inoculum size is shown on the x-axis and % invasion efficiency (number of bacteria recovered from the lysed Caco-2 cells divided by number of bacteria used for infection ×100) is indicated on the y-axis. Data shown represents invasion assay data from three independent experiments. Each box encloses the central 50th percentile of the data values with the median value displayed as a horizontal line, vertical lines protracting from each box represent the maximum and minimum values. Invasion efficiencies were not different (ANOVA, *P* > 0.7).
